

Chapter 25

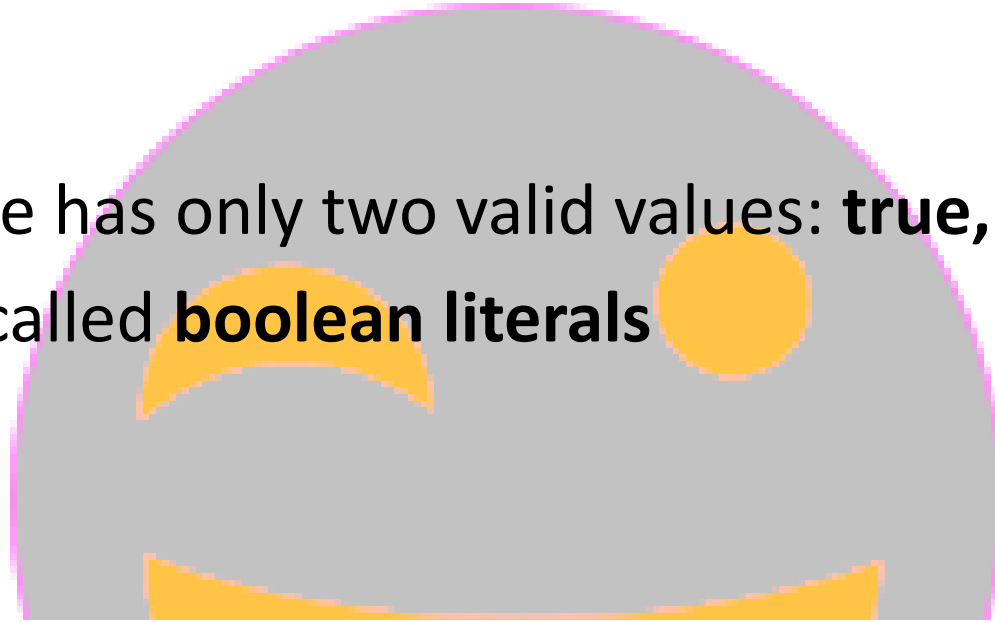

Java data types -boolean

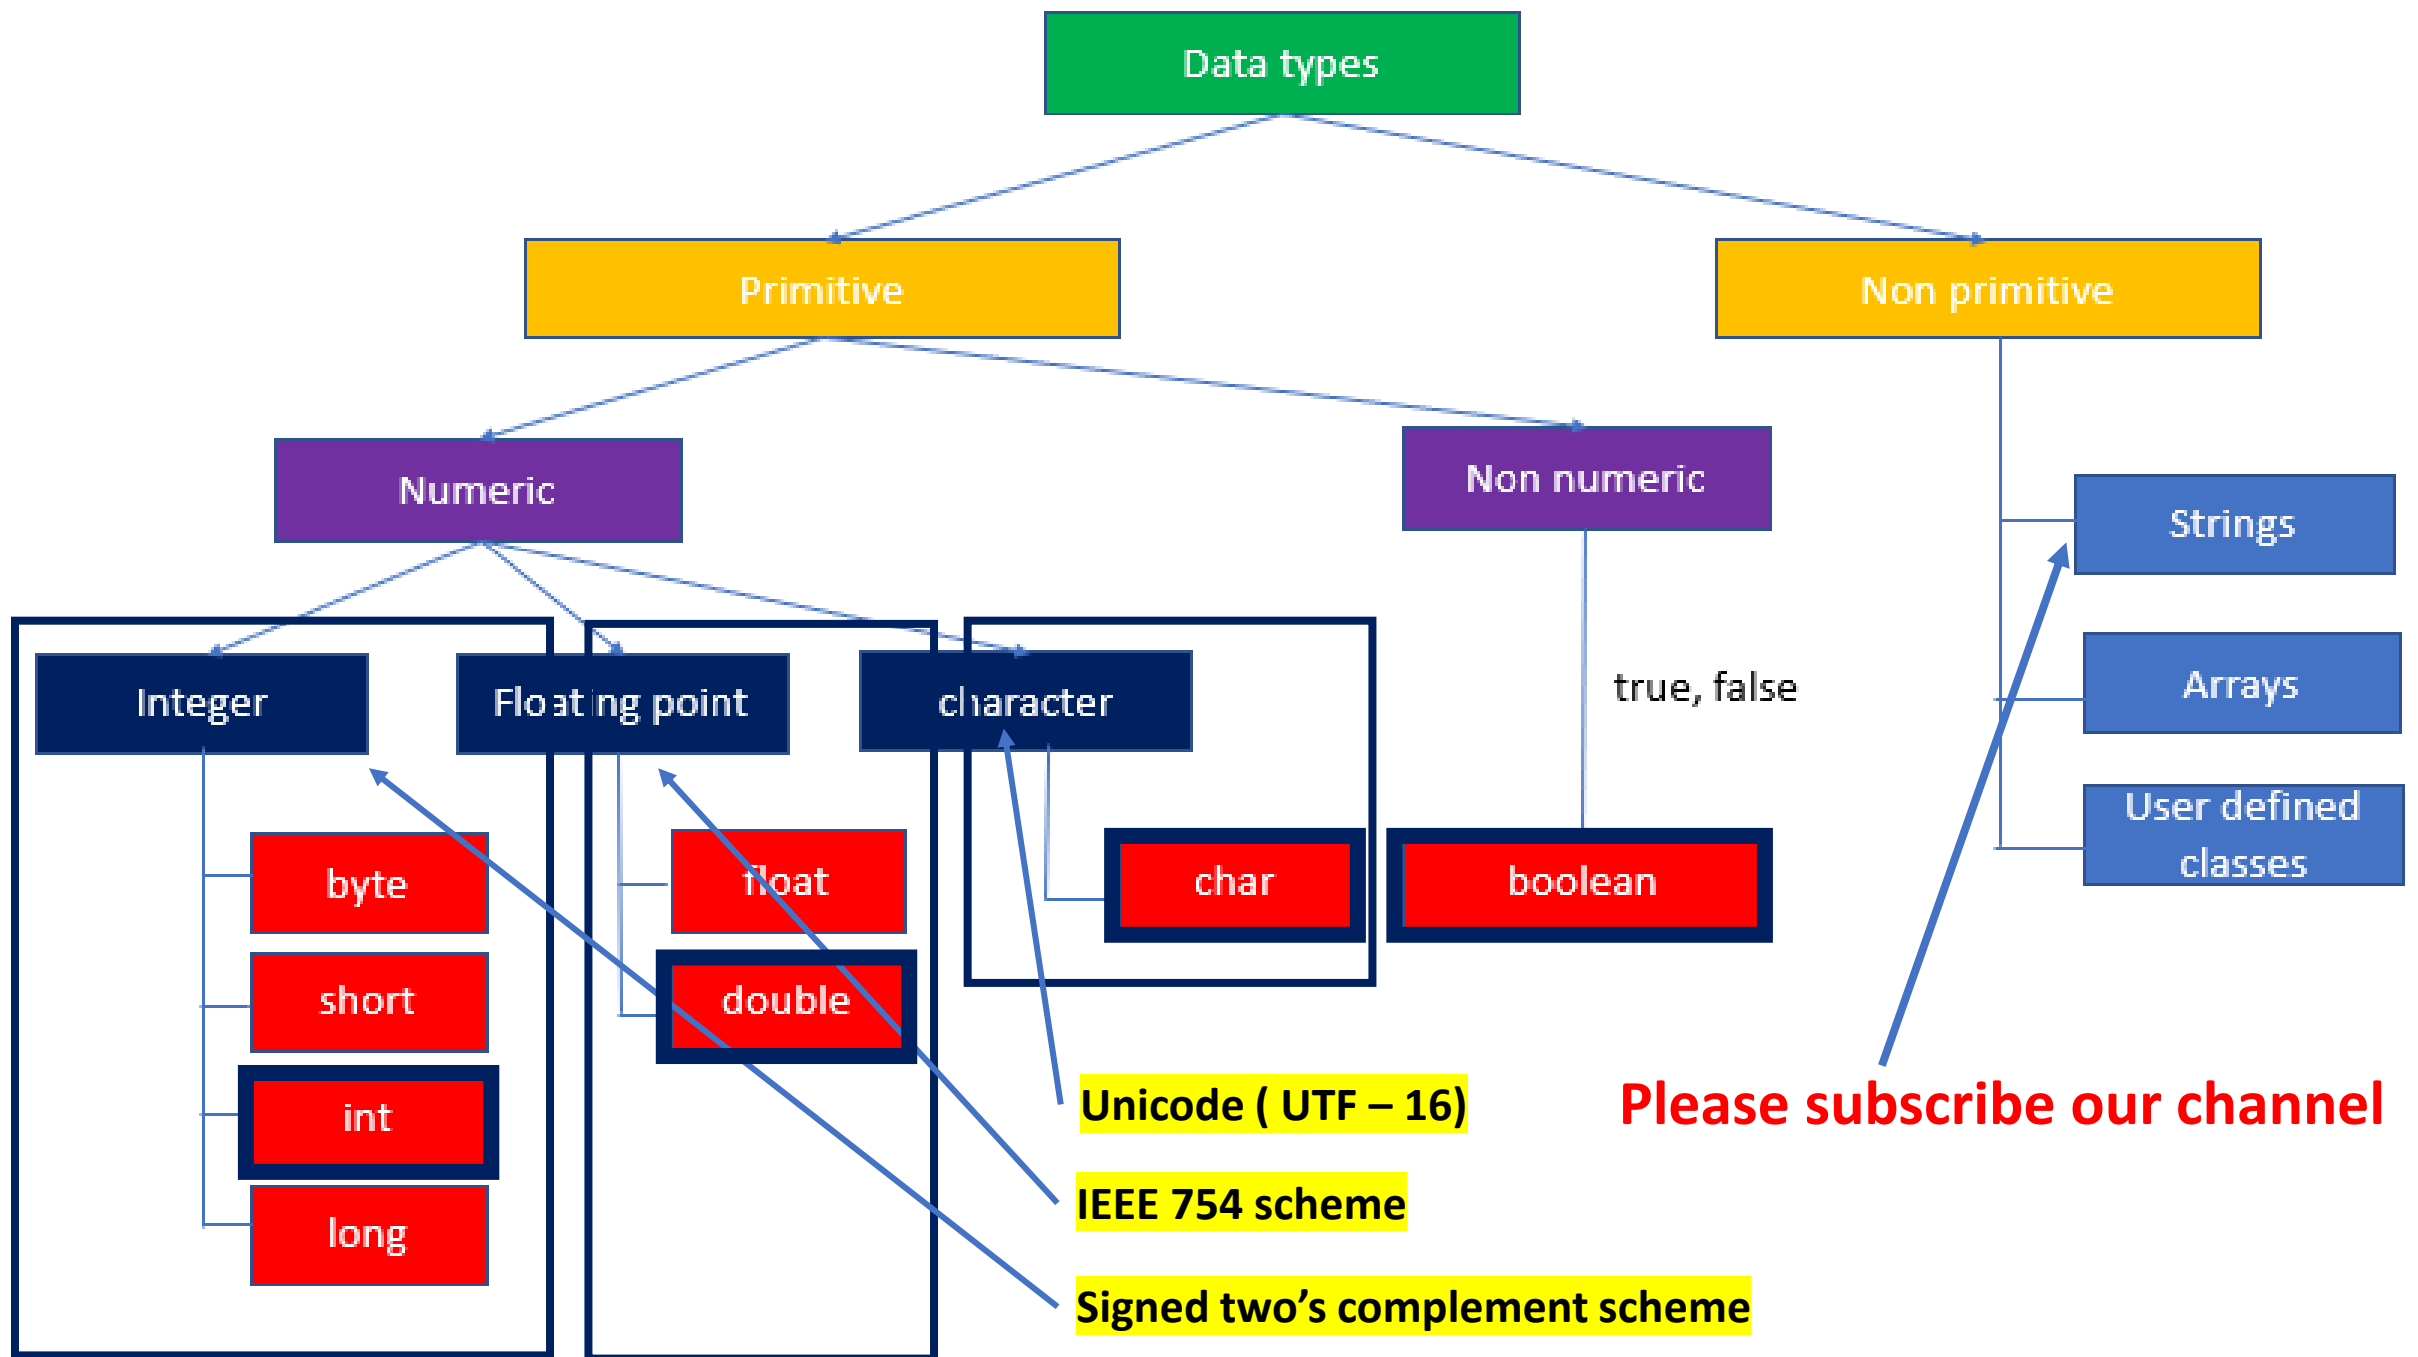

boolean

- A **boolean** data type has only two valid values: **true**, **false**
- **true** and **false** are called **boolean literals**

```
void booleanDemo () {  
    heading("boolean");  
    System.out.println(booleanBasket);  
    booleanBasket = true;  
    if(booleanBasket) {  
        System.out.println("Primitive data types \ncompleted successfully");  
    }  
}
```
